=((0.3024911) * (0.59075) * (0.09363545))/(((0.3024911) * (0.59075) * (0.09363545))+((0.2893382) * (0.09363545))
(0.5974265) * (0.9063645)))
= 0.09649284
******PART F: The Results between the Pivot table and calculated Naive Bayes value differs. For the
Naive Bayes a value probability of 0.09649284 was achieved whereas the Pivot Table indicated a probability
of 0.08952381 for the P(Loan=1 | CC=1, Online=1) statement. The Naive Bayes calculation is higher than
the value in the Pivot table. The Naive Bayes calculation is not exact as we are making assumptions. Only
the numerator is approximated in this calculation. The probability value in the pivot table is therefore more
accurate.
PART G:
```
